Editorial Index, Volume 46

How to use this index

This Modern Plastics Index is prepared as a cross-referenced guide to general, engineering, and technical features. It is arranged by materials, application areas, processing equipment and methods, and other pertinent subdivisions. In addition, many subjects are individually cross-referenced by one or more key words.

- If you want to locate in one segment of the index all the important published information on, for example, **Epoxies**, **Building Applications**, or **Blow Molding**, locate the appropriate bold face subheadings, under which you will find the entire list.
- If you are looking for a specific article dealing with a plastics material, a production method, and/or an application, it will be found cross-referenced under one or all of these areas.
- If only the general theme of an article is known, you can quickly locate it by checking through those subheads relating to that theme.
- For added convenience in reference, the following keys in indexed items indicate the nature of the indexed article or the section of the magazine in which it appears: (pl) = Plasticscope; (eng) = Engineering Feature; (tech) = Technical Feature; (ma) = Machinery and Equipment. Unkeyed items are of a more general nature.

Note: Every issue of Modern Plastics carries a number of timely news articles which are not considered as reference material and are not included in this Index. These include many Plasticscope announcements, Company News items, a calendar of Coming Events, Manufacturers' Literature, and Patents.
